5 1,2-DIAZEPANE DERIVATIVES AS INTERLEUKIN-1BETA CONVERTING ENZYME INHIBITORS

TECHNICAL FIELD OF THE INVENTION

The present invention relates to novel classes of compounds which are caspase inhibitors, in particular 10 interleukin-1 β converting enzyme ("ICE") inhibitors. This invention also relates to pharmaceutical compositions comprising these compounds. The compounds and pharmaceutical compositions of this invention are particularly well suited for inhibiting caspase activity 15 and consequently, may be advantageously used as agents against interleukin-1- ("IL-1"), apoptosis-, interferon- γ inducing factor- (IGIF), or interferon- γ - ("IFN- γ ") mediated diseases, including inflammatory diseases, autoimmune diseases, destructive bone disorders, 20 proliferative disorders, infectious diseases, and degenerative diseases. This invention also relates to methods for inhibiting caspase activity and decreasing IGIF production and IFN- γ production and methods for treating interleukin-1, apoptosis-, and interferon- γ - 25 mediated diseases using the compounds and compositions of this invention. This invention also relates to methods of preparing the compounds of this invention.

BACKGROUND OF THE INVENTION

30 Interleukin 1 ("IL-1") is a major pro-inflammatory and immunoregulatory protein that stimulates fibroblast differentiation and proliferation, the production of prostaglandins, collagenase and phospholipase by synovial cells and chondrocytes,

- 2 -

basophil and eosinophil degranulation and neutrophil activation. Oppenheim, J.H. et al, Immunology Today, 7, pp. 45-56 (1986). As such, it is involved in the pathogenesis of chronic and acute inflammatory and 5 autoimmune diseases. For example, in rheumatoid arthritis, IL-1 is both a mediator of inflammatory symptoms and of the destruction of the cartilage proteoglycan in afflicted joints. Wood, D.D. et al., Arthritis Rheum. 26, 975, (1983); Pettipher, E.J. et al., 10 Proc. Natl. Acad. Sci. USA 71, 295 (1986); Arend, W.P. and Dayer, J.M., Arthritis Rheum. 38, 151 (1995). IL-1 is also a highly potent bone resorption agent. Jandiski, J.J., J. Oral Path. 17, 145 (1988); Dewhirst, F.E. et al., J. Immunol. 8, 2562 (1985). It is alternately referred to 15 as "osteoclast activating factor" in destructive bone diseases such as osteoarthritis and multiple myeloma. Bataille, R. et al., Int. J. Clin. Lab. Res. 21(4), 283 (1992). In certain proliferative disorders, such as acute myelogenous leukemia and multiple myeloma, IL-1 can 20 promote tumor cell growth and adhesion. Bani, M.R., J. Natl. Cancer Inst. 83, 123 (1991); Vidal-Vanaclocha, F., Cancer Res. 54, 2667 (1994). In these disorders, IL-1 also stimulates production of other cytokines such as IL-6, which can modulate tumor development (Tartour et al., 25 Cancer Res. 54, p. 6243 (1994)). IL-1 is predominantly produced by peripheral blood monocytes as part of the inflammatory response and exists in two distinct agonist forms, IL-1 α and IL-1 β . Mosely, B.S. et al., Proc. Natl. Acad. Sci., 84, pp. 4572-4576 (1987); Lonnemann, G. et 30 al., Eur. J. Immunol., 19, pp. 1531-1536 (1989).

IL-1 β is synthesized as a biologically inactive precursor, pIL-1 β . pIL-1 β lacks a conventional leader sequence and is not processed by a signal peptidase. March, C.J., Nature, 315, pp. 641-647 (1985). Instead, 35 pIL-1 β is cleaved by interleukin-1 β converting enzyme

- 3 -

("ICE") between Asp-116 and Ala-117 to produce the biologically active C-terminal fragment found in human serum and synovial fluid. Sleath, P.R., et al., J. Biol. Chem., 265, pp. 14526-14528 (1992); A.D. Howard et al., 5 J. Immunol., 147, pp. 2964-2969 (1991). ICE is a cysteine protease localized primarily in monocytes. It converts precursor IL-1 β to the mature form. Black, R.A. et al., FEBS Lett., 247, pp. 386-390 (1989); Kostura, M.J. et al., Proc. Natl. Acad. Sci. U.S.A., 86, pp. 5227-10 5231 (1989). Processing by ICE is also necessary for the transport of mature IL-1 β through the cell membrane.

ICE is a member of a family of homologous enzymes called caspases. These homologs have sequence similarities in the active site regions of the enzymes. 15 Such homologs (caspases) include TX (or ICE_{rel-II} or ICH-2) (Faucheu, et al., EMBO J., 14, p. 1914 (1995); Kamens J., et al., J. Biol. Chem., 270, p. 15250 (1995); Nicholson et al., J. Biol. Chem., 270 15870 (1995)), TY (or ICE_{rel-III}) (Nicholson et al., J. Biol. Chem., 270, 20 p. 15870 (1995); ICH-1 (or Nedd-2) (Wang, L. et al., Cell, 78, p. 739 (1994)), MCH-2, (Fernandes-Alnemri, T. et al., Cancer Res., 55, p. 2737 (1995), CPP32 (or YAMA or apopain) (Fernandes-Alnemri, T. et al., J. Biol. Chem., 269, p. 30761 (1994); Nicholson, D.W. et al., 25 Nature, 376, p. 37 (1995)), and CMH-1 (or MCH-3) (Lippke, et al., J. Biol. Chem., (1996); Fernandes-Alnemri, T. et al., Cancer Res., (1995)).

Each of these ICE homologs, as well as ICE itself, is capable of inducing apoptosis when 30 overexpressed in transfected cell lines. Inhibition of one or more of these homologs with the peptidyl ICE inhibitor Tyr-Val-Ala-Asp-chloromethylketone results in inhibition of apoptosis in primary cells or cell lines. Lazebnik et al., Nature, 371, p. 346 (1994).

- 4 -

Caspases also appear to be involved in the regulation of programmed cell death or apoptosis. Yuan, J. et al., Cell, 75, pp. 641-652 (1993); Miura, M. et al., Cell, 75, pp. 653-660 (1993); Nett-Fiordalisi, M.A. et al., J. Cell Biochem., 17B, p. 117 (1993). In particular, ICE or ICE homologs are thought to be associated with the regulation of apoptosis in neurodegenerative diseases, such as Alzheimer's and Parkinson's disease. Marx, J. and M. Baringa, Science, 259, pp. 760-762 (1993); Gagliardini, V. et al., Science, 263, pp. 826-828 (1994). Therapeutic applications for inhibition of apoptosis may include treatment of Alzheimer's disease, Parkinson's disease, stroke, myocardial infarction, spinal atrophy, and aging.

ICE has been demonstrated to mediate apoptosis (programmed cell death) in certain tissue types. Steller, H., Science, 267, p. 1445 (1995); Whyte, M. and Evan, G., Nature, 376, p. 17 (1995); Martin, S.J. and Green, D.R., Cell, 82, p. 349 (1995); Alnemri, E.S., et al., J. Biol. Chem., 270, p. 4312 (1995); Yuan, J. Curr. Opin. Cell Biol., 7, p. 211 (1995). A transgenic mouse with a disruption of the ICE gene is deficient in Fas-mediated apoptosis (Kuida, K. et al., Science 267, 2000 (1995)). This activity of ICE is distinct from its role as the processing enzyme for pro-IL-1 β . It is conceivable that in certain tissue types, inhibition of ICE may not affect secretion of mature IL-1 β , but may inhibit apoptosis.

Enzymatically active ICE has been previously described as a heterodimer composed of two subunits, p20 and p10 (20kDa and 10kDa molecular weight, respectively). These subunits are derived from a 45kDa proenzyme (p45) by way of a p30 form, through an activation mechanism that is autocatalytic. Thornberry, N.A. et al., Nature, 356, pp. 768-774 (1992). The ICE proenzyme has been

- 5 -

divided into several functional domains: a prodomain (p14), a p22/20 subunit, a polypeptide linker and a p10 subunit. Thornberry et al., supra; Casano et al., Genomics, 20, pp. 474-481 (1994).

5 Full length p45 has been characterized by its cDNA and amino acid sequences. PCT patent applications WO 91/15577 and WO 94/00154. The p20 and p10 cDNA and amino acid sequences are also known. Thornberry et al., supra. Murine and rat ICE have also been sequenced and
10 cloned. They have high amino acid and nucleic acid sequence homology to human ICE. Miller, D.K. et al., Ann. N.Y. Acad. Sci., 696, pp. 133-148 (1993); Molineaux, S.M. et al., Proc. Nat. Acad. Sci., 90, pp. 1809-1813 (1993). The three-dimensional structure of ICE has been
15 determined at atomic resolution by X-ray crystallography. Wilson, K.P., et al., Nature, 370, pp. 270-275 (1994). The active enzyme exists as a tetramer of two p20 and two p10 subunits.

Recently, ICE and other members of the ICE/CED-
20 3 family have been linked to the conversion of pro-IGIF to IGIF or to the production of IFN- γ in vivo (PCT application PCT/US96/20843, filed 12/20/96, published 6/26/97 under publication no. WO 97/22619, which is incorporated herein by reference). IGIF is synthesized
25 in vivo as the precursor protein "pro-IGIF".

Interferon-gamma inducing factor (IGIF) is an approximately 18-kDa polypeptide that stimulates T-cell production of interferon-gamma (IFN- γ). IGIF is produced by activated Kupffer cells and macrophages in vivo and is
30 exported out of such cells upon endotoxin stimulation. Thus, a compound that decreases IGIF production would be useful as an inhibitor of such T-cell stimulation which in turn would reduce the levels of IFN- γ production by those cells.

- 6 -

IFN- γ is a cytokine with immunomodulatory effects on a variety of immune cells. In particular, IFN- γ is involved in macrophage activation and Th1 cell selection (F. Belardelli, APMIS, 103, p. 161 (1995)).

5 IFN- γ exerts its effects in part by modulating the expression of genes through the STAT and IRF pathways (C. Schindler and J.E. Darnell, Ann. Rev. Biochem., 64, p. 621 (1995); T. Taniguchi, J. Cancer Res. Clin. Oncol., 121, p. 516 (1995)).

10 Mice lacking IFN- γ or its receptor have multiple defects in immune cell function and are resistant to endotoxic shock (S. Huang et al., Science, 259, p. 1742 (1993); D. Dalton et al., Science, 259, p. 1739 (1993); B.D. Car et al., J. Exp. Med., 179, p. 1437 (1994)).

15 Along with IL-12, IGIF appears to be a potent inducer of IFN- γ production by T cells (H. Okamura et al., Infection and Immunity, 63, p. 3966 (1995); H. Okamura et al., Nature, 378, p. 88 (1995); S. Ushio et al., J. Immunol., 156, p. 4274 (1996)).

20 IFN- γ has been shown to contribute to the pathology associated with a variety of inflammatory, infectious and autoimmune disorders and diseases. Thus, compounds capable of decreasing IFN- γ production would be useful to ameliorate the effects of IFN- γ related pathologies.

25 Accordingly, compositions and methods capable of regulating the conversion of pro-IGIF to IGIF would be useful for decreasing IGIF and IFN- γ production in vivo, and thus for ameliorating the detrimental effects of these proteins which contribute to human disorders and diseases.

30 Caspase inhibitors represent a class of compounds useful for the control of inflammation or apoptosis or both. Peptide and peptidyl inhibitors of ICE have been described. PCT patent applications WO

- 7 -

91/15577; WO 93/05071; WO 93/09135; WO 93/14777 and WO 93/16710; and European patent application 0 547 699. Such peptidyl inhibitors of ICE have been observed to block the production of mature IL-1 β in a mouse model of
5 inflammation (*vide infra*) and to suppress growth of leukemia cells *in vitro* (Estrov et al., *Blood* 84, 380a (1994)). However, due to their peptidic nature, such inhibitors are typically characterized by undesirable pharmacologic properties, such as poor cellular
10 penetration and cellular activity, poor oral absorption, poor stability and rapid metabolism. Plattner, J.J. and D.W. Norbeck, in *Drug Discovery Technologies*, C.R. Clark and W.H. Moos, Eds. (Ellis Horwood, Chichester, England, 1990), pp. 92-126. This has hampered their development
15 into effective drugs.

Non-peptidyl compounds have also been reported to inhibit ICE *in vitro*. PCT patent application WO 95/26958; US Patent 5,552,400; Dolle et al., *J. Med. Chem.*, 39, pp. 2438-2440 (1996). It is not clear however
20 whether these compounds have the appropriate pharmacological profiles to be therapeutically useful.

Accordingly, the need exists for compounds that can effectively inhibit caspases for use as agents for preventing and treating chronic and acute forms of IL-1-mediated diseases, apoptosis-, IGF-, or IFN- γ -mediated diseases, as well as inflammatory, autoimmune, destructive bone, proliferative, infectious, or degenerative diseases.

30

SUMMARY OF THE INVENTION

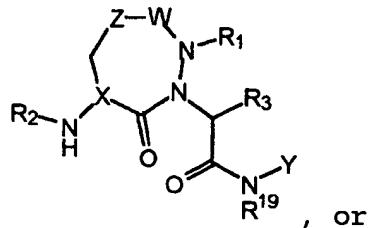

The present invention provides novel classes of compounds, and pharmaceutically acceptable derivatives thereof, that are useful as caspases inhibitors, in particular as ICE inhibitors. These compounds can be
35 used alone or in combination with other therapeutic or

- 8 -

prophylactic agents, such as antibiotics, immunomodulators or other anti-inflammatory agents, for the treatment or prophylaxis of diseases mediated by IL-1, apoptosis, IGIF or IFN- γ . According to a preferred 5 embodiment, the compounds of this invention are capable of binding to the active site of ICE and inhibiting the activity of that enzyme.

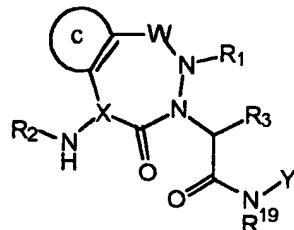

It is a principal object of this invention to provide novel classes of compounds represented by 10 formulas:

(I)

, or

(II)

wherein the various substituents are described 15 herein.

This invention also provides compositions comprising compounds represented by formulae (I) and (II), methods for using these compositions in the treatment or prevention of various disorders, and methods 20 for preparing these compounds.

DETAILED DESCRIPTION OF THE INVENTION

In order that the invention described herein may be more fully understood, the following detailed description is set forth.

5 The following abbreviations and definitions are used throughout the application.

Abbreviations

	Ac ₂ O	acetic anhydride
	n-Bu	normal-butyl
10	DMF	dimethylformamide
	DIEA	N,N-diisopropylethylamine
	EDC	1-(3-Dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride
	Et ₂ O	diethyl ether
15	EtoAc	ethyl acetate
	Fmoc	9-fluorenylmethyloxycarbonyl
	HBTU	O-benzotriazol-1-yl-N,N,N',-
		tetramethyluronium hexafluorophosphate
	HOBT	1-hydroxybenzotriazole hydrate
20	MeOH	methanol
	TFA	trifluoroacetic acid

The term "caspase" refers to an enzyme that is a member of the family of enzymes that includes ICE (see 25 H. Hara, Natl. Acad. Sci., 94, pp. 2007-2012 (1997).

The terms "HBV", "HCV" and "HGV" refer to hepatitis-B virus, hepatitis-C virus and hepatitis-G virus, respectively.

30 The term "K_i" refers to a numerical measure of the effectiveness of a compound in inhibiting the activity of a target enzyme such as ICE. Lower values of K_i reflect higher effectiveness. The K_i value is a derived by fitting experimentally determined rate data to standard enzyme kinetic equations (see I.H. Segel, Enzyme Kinetics, Wiley-Interscience, 1975).

- 10 -

The term "interferon gamma inducing factor" or "IGIF" refers to a factor which is capable of stimulating the endogenous production of IFN- γ .

The term "caspase inhibitor" refers to a compound which is capable of demonstrating detectable inhibition of one or more caspases. The term "ICE inhibitor" refers to a compound which is capable of demonstrating detectable inhibition of ICE and optionally of one or more additional caspases. Inhibition of these enzymes may be determined using the methods described and incorporated by reference herein. The skilled practitioner realizes that an in vivo enzyme inhibitor is not necessarily an in vitro enzyme inhibitor. For example, a prodrug form of a compound typically demonstrates little or no activity in in vitro assays. Such prodrug forms may be altered by metabolic or other biochemical processes in the patient to provide an in vivo enzyme inhibitor.

The term "cytokine" refers to a molecule which mediates interactions between cells.

The term "condition" refers to any disease, disorder or effect that produces deleterious biological consequences in a subject.

The term "subject" refers to an animal, or to one or more cells derived from an animal. Preferably, the animal is a mammal, most preferably a human. Cells may be in any form, including but not limited to cells retained in tissue, cell clusters, immortalized cells, transfected or transformed cells, and cells derived from an animal that have been physically or phenotypically altered.

The term "patient" as used in this application refers to any mammal, preferably humans.

- 11 -

The term "alkyl" refers to a straight-chained or branched, saturated aliphatic hydrocarbon containing 1 to 6 carbon atoms.

5 The term "alkenyl" refers to a straight-chained or branched unsaturated hydrocarbon containing 2 to 6 carbon atoms and at least one double bond.

The term "alkynyl" refers to a straight-chained or branched unsaturated hydrocarbon containing 2 to 6 carbon atoms and at least one triple bond.

10 The term "cycloalkyl" refers to a mono- or polycyclic, non-aromatic, hydrocarbon ring system which may optionally contain unsaturated bonds in the ring system. Examples include cyclohexyl, adamantyl and norbornyl.

15 The term "aryl" refers to a mono- or polycyclic ring system which contains 6, 10, 12 or 14 carbons in which at least one ring of the ring system is aromatic. The aryl groups of this invention are optionally singly or multiply substituted with R¹⁷. Examples of aryl ring systems include, phenyl, naphthyl, and tetrahydronaphthyl.

20 The term "heteroaryl" refers to a mono- or polycyclic ring system which contains 1 to 15 carbon atoms and 1 to 4 heteroatoms, and in which at least one ring of the ring system is aromatic. Heteroatoms are sulfur, nitrogen or oxygen. The heteroaryl groups of this invention are optionally singly or multiply substituted with R¹⁷.

25 The term "heterocyclic" refers to a mono- or polycyclic ring system which contains 1 to 15 carbon atoms and 1 to 4 heteroatoms, in which the mono- or polycyclic ring system may optionally contain unsaturated bonds but is not aromatic. Heteroatoms are independently sulfur, nitrogen, or oxygen.

- 12 -

The term "alkylaryl" refers to an alkyl group, wherein one or more hydrogen atoms of the alkyl group is replaced by one or more aryl radical.

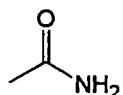

5 The term "alkylheteroaryl" refers to an alkyl group, wherein a hydrogen atom of the alkyl group is replaced by a heteroaryl radical.

The term "substitute" refers to the replacement of a hydrogen atom in a compound with a substituent group.

10 The term "straight chain" refers to a contiguous unbranching string of covalently bound atoms. The straight chain may be substituted, but these substituents are not a part of the straight chain.

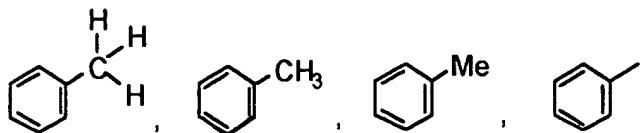

15 The term "amino acid side chain" refers to the substituent bound to the α -carbon of either a natural or a non-natural α -amino acid.

20 In chemical formulas, parenthesis are used herein to denote connectivity in molecules or groups. In particular, parentheses are used to indicate: 1) that more than one atom or group is bonded to a particular atom; or 2) a branching point (i.e., the atom immediately before the open parenthesis is bonded both to the atom or group in the parentheses and the atom or group immediately after the closed parenthesis). An example of 25 the first use is " $-\text{N}(\text{alkyl})_2$ ", indicating two alkyl groups bond to an N atom. An example of the second use is " $-\text{C}(\text{O})\text{NH}_2$ ", indicating a carbonyl group and an amino (" NH_2 ") group both bonded to the indicated carbon atom. A " $-\text{C}(\text{O})\text{NH}_2$ " group may be represented in other ways, 30 including the following structure:

- 13 -

Substituents may be represented in various forms. These various forms are known to the skilled practitioner and may be used interchangeably. For example, a methyl substituent on a phenyl ring may be 5 represented in any of the following forms:

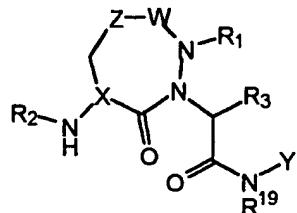

Various forms of substituents such as methyl are used herein interchangeably.

10 Other definitions are set forth in the specification where necessary.

The compounds of this invention may contain one or more "asymmetric" carbon atoms and thus may occur as 5 racemates and racemic mixtures, single enantiomers, diastereomeric mixtures and individual diastereomers. Each stereogenic carbon may be of the R or S configuration. Although specific compounds and scaffolds exemplified in this application may be depicted in a 10 particular stereochemical configuration, compounds and scaffolds having either the opposite stereochemistry at any given chiral center or mixtures thereof are also envisioned.

All such isomeric forms of these compounds are 15 expressly included in the present invention, as well as pharmaceutically acceptable derivative thereof.

The term "pharmaceutically acceptable derivative" means any pharmaceutically acceptable salt, ester, or salt of such ester, of a compound of this 20 invention or any other compound which, upon administration to a recipient, is capable of providing (directly or indirectly) a compound of this invention or an anti-ICE active metabolite or residue thereof.

Pharmaceutically acceptable salts of the 25 compounds of this invention include, for example, those derived from pharmaceutically acceptable inorganic and organic acids and bases. Examples of suitable acids include hydrochloric, hydrobromic, sulfuric, nitric, perchloric, fumaric, maleic, phosphoric, glycolic, lactic, salicylic, succinic, toluene-p-sulfonic, 30 tartaric, acetic, citric, methanesulfonic, formic,

benzoic, malonic, naphthalene-2-sulfonic and benzenesulfonic acids. Other acids, such as oxalic, while not in themselves pharmaceutically acceptable, may be employed in the preparation of salts useful as
5 intermediates in obtaining the compounds of the invention and their pharmaceutically acceptable acid addition salts. Salts derived from appropriate bases include alkali metal (e.g., sodium), alkaline earth metal (e.g., magnesium), ammonium and N-(C₁₋₄ alkyl)₄⁺ salts.

10 This invention also envisions the "quaternization" of any basic nitrogen-containing groups of the compounds disclosed herein. The basic nitrogen can be quaternized with any agents known to those of ordinary skill in the art including, for example, lower
15 alkyl halides, such as methyl, ethyl, propyl and butyl chloride, bromides and iodides; dialkyl sulfates including dimethyl, diethyl, dibutyl and diamyl sulfates; long chain halides such as decyl, lauryl, myristyl and stearyl chlorides, bromides and iodides; and aralkyl
20 halides including benzyl and phenethyl bromides. Water or oil-soluble or dispersible products may be obtained by such quaternization.

When multiply substituted, each substituent may be picked independently of any other substituent as long
25 as the combination of substituents results in the formation of a stable compound.

Combinations of substituents and variables envisioned by this invention are only those that result in the formation of stable compounds. The term "stable",
30 as used herein, refers to compounds which possess stability sufficient to allow manufacture and administration to a mammal by methods known in the art. Typically, such compounds are stable at a temperature of 40 °C or less, in the presence or absence of moisture or

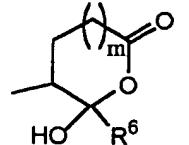

- 36 -

other chemically reactive conditions, for at least a week.

Preferred compounds of this invention may be readily absorbed by the bloodstream of patients upon oral administration. This oral availability makes such compounds excellent agents for orally-administered treatment and prevention regimens against IL-1-, apoptosis-, IGIF-, or IFN- γ -mediated diseases.

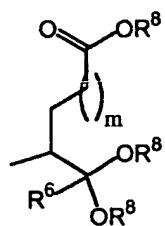

It should be understood that the compounds of this invention may exist in various equilibrium forms, depending on conditions including choice of solvent, pH, and others known to the practitioner skilled in the art. All such forms of these compounds are expressly included in the present invention. In particular, many of the compounds of this invention, especially those which contain aldehyde or ketone groups and carboxylic acid groups in Y, may take hemi-acetal or hemi-ketal or hydrated forms. For example, compounds of embodiment (A) are in a hemi-acetal or hemi-ketal form when Y is:

20

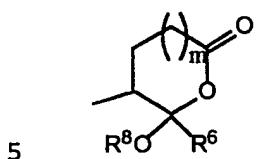

Depending on the choice of solvent and other conditions known to the practitioner skilled in the art, compounds of this invention may also take hydrated, acyloxy ketal, acyloxy acetal, ketal, acetal or enol forms. For example, compounds of this invention are in hydrated forms when Y is:

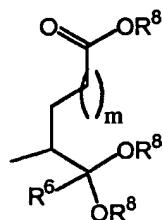

- 37 -

acyloxy ketal or acyloxy acetal forms when Y is:

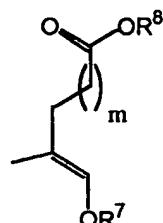

ketal or acetal forms when Y is:

10

and enol forms when Y is:

15

In addition, it should be understood that the equilibrium forms of the compounds of this invention may include tautomeric forms. All such forms of these

compounds are expressly included in the present invention.

The compounds of formulae (I) and (II) may be synthesized using conventional techniques.

5 Advantageously, these compounds are conveniently synthesized from readily available starting materials.

The compounds of this invention are among the most readily synthesized caspase inhibitors known. Many of the previously described caspase or ICE inhibitors 10 contain four or more chiral centers and numerous peptide linkages. The relative ease with which the compounds of this invention can be synthesized represents an advantage in the large scale production of these compounds.

For example, compounds of this invention may be 15 prepared using the processes described herein. As can be appreciated by the skilled practitioner, these processes are not the only means by which the compounds described and claimed in this application may be synthesized. Further methods will be evident to those of ordinary 20 skill in the art. Additionally, the various synthetic steps described herein may be performed in an alternate sequence or order to give the desired compounds.

It should be understood that the compounds of this invention may be modified by appropriate 25 functionalities to enhance selective biological properties. Such modifications are known in the art and include those which increase biological penetration into a given biological system (e.g., blood, lymphatic system, central nervous system), increase oral availability, 30 increase solubility to allow administration by injection, alter metabolism and alter rate of excretion. In addition, the compounds may be altered to pro-drug form such that the desired compound is created in the body of the patient as the result of the action of metabolic or 35 other biochemical processes on the pro-drug. Such pro-

drug forms typically demonstrate little or no activity in in vitro assays. Some examples of pro-drug forms include ketal, acetal, oxime, imine and hydrazone forms of compounds which contain ketone or aldehyde groups,
5 especially where they occur in the Y group of the compounds of this invention. Other examples of pro-drug forms include the hemi-ketal, hemi-acetal, acyloxy ketal, acyloxy acetal, ketal, acetal and enol forms that are described herein.

10

Compositions and Methods

The compounds of this invention are caspase inhibitors, particularly ICE inhibitors. Accordingly, these compounds are capable of targeting and inhibiting events in IL-1-, apoptosis-, IGF-1, and IFN- γ -mediated diseases, and, thus, the ultimate activity of that protein in inflammatory diseases, autoimmune diseases, destructive bone, proliferative disorders, infectious diseases, and degenerative diseases. For example, the compounds of this invention inhibit the conversion of precursor IL-1 β to mature IL-1 β by inhibiting ICE. Because ICE is essential for the production of mature IL-1, inhibition of that enzyme effectively blocks initiation of IL-1-mediated physiological effects and symptoms, such as inflammation, by inhibiting the production of mature IL-1. Thus, by inhibiting IL-1 β precursor activity, the compounds of this invention effectively function as IL-1 inhibitors.
20
25

Compounds of this invention also inhibit conversion of pro-IGF-1 into active, mature IGF-1 by inhibiting ICE. Because ICE is essential for the production of mature IGF-1, inhibition of ICE effectively blocks initiation of IGF-1-mediated physiological effects and symptoms, by inhibiting production of mature IGF-1.
30
35 IGF-1 is in turn essential for the production of IFN- γ . ICE

therefore effectively blocks initiation of IFN- γ - mediated physiological effects and symptoms, by inhibiting production of mature IGIF and thus production of IFN- γ .

5 The pharmaceutical compositions and methods of this invention, therefore, will be useful for controlling caspase activity in vivo. The compositions and methods of this invention will thus be useful for controlling IL-1, IGIF or IFN- γ levels in vivo and for treating or reducing the advancement, severity or effects of IL-1-,
10 apoptosis-, IGIF-, or IFN- γ -mediated conditions, including diseases, disorders or effects.

15 Pharmaceutical compositions of this invention comprise a compound of formulae (I) or (II) or a pharmaceutically acceptable salt thereof and a pharmaceutically acceptable carrier. Such compositions may optionally comprise an additional therapeutic agent. Such agents include, but are not limited to, an anti-inflammatory agent, a matrix metalloprotease inhibitor, a lipoxygenase inhibitor, a cytokine antagonist, an
20 immunosuppressant, an anti-cancer agent, an anti-viral agent, a cytokine, a growth factor, an immunomodulator, a prostaglandin or an anti-vascular hyperproliferation compound.

25 The term "pharmaceutically acceptable carrier" refers to a non-toxic carrier that may be administered to a patient, together with a compound of this invention, and which does not destroy the pharmacological activity thereof.

30 Pharmaceutically acceptable carriers that may be used in the pharmaceutical compositions of this invention include, but are not limited to, ion exchangers, alumina, aluminum stearate, lecithin, serum proteins, such as human serum albumin, buffer substances such as phosphates, glycine, sorbic acid, potassium sorbate, partial glyceride mixtures of saturated

vegetable fatty acids, water, salts or electrolytes, such
as protamine sulfate, disodium hydrogen phosphate,
potassium hydrogen phosphate, sodium chloride, zinc
salts, colloidal silica, magnesium trisilicate, polyvinyl
5 pyrrolidone, cellulose-based substances, polyethylene
glycol, sodium carboxymethylcellulose, polyacrylates,
waxes, polyethylene-polyoxypropylene-block polymers, wool
fat and self-emulsifying drug delivery systems (SEDDS)
such as α -tocopherol, polyethyleneglycol 1000 succinate,
10 or other similar polymeric delivery matrices.

In pharmaceutical composition comprising only a compound of formulae (I) or (II) as the active component, methods for administering these compositions may additionally comprise the step of administering to the 15 subject an additional agent. Such agents include, but are not limited to, an anti-inflammatory agent, a matrix metalloprotease inhibitor, a lipoxygenase inhibitor, a cytokine antagonist, an immunosuppressant, an anti-cancer agent, an anti-viral agent, a cytokine, a growth factor, 20 an immunomodulator, a prostaglandin or an anti-vascular hyperproliferation compound.

The term "pharmaceutically effective amount" refers to an amount effective in treating or ameliorating an IL-1-, apoptosis-, IGIF- or IFN- γ -mediated disease in a 25 patient. The term "prophylactically effective amount" refers to an amount effective in preventing or substantially lessening IL-1-, apoptosis-, IGIF- or IFN- γ -mediated diseases in a patient.

The compounds of this invention may be employed 30 in a conventional manner for controlling IGIF and IFN- γ levels in vivo and for treating diseases or reducing the advancement or severity of effects which are mediated by IL-1, apoptosis, IGIF or IFN- γ . Such methods of treatment, their dosage levels and requirements may be

- 42 -

selected by those of ordinary skill in the art from available methods and techniques.

For example, a compound of this invention may be combined with a pharmaceutically acceptable adjuvant for administration to a patient suffering from an IL-1-, apoptosis-, IGIF- or IFN- γ -mediated disease in a pharmaceutically acceptable manner and in an amount effective to lessen the severity of that disease.

Alternatively, the compounds of this invention may be used in compositions and methods for treating or protecting individuals against IL-1, apoptosis-, IGIF, or IFN- γ mediated diseases over extended periods of time. The compounds may be employed in such compositions either alone or together with other compounds of this invention in a manner consistent with the conventional utilization of enzyme inhibitors in pharmaceutical compositions. For example, a compound of this invention may be combined with pharmaceutically acceptable adjuvants conventionally employed in vaccines and administered in prophylactically effective amounts to protect individuals over an extended period of time against IL-1-, apoptosis-, IGIF, or IFN- γ mediated diseases.

The compounds of formulae (I) or (II) may also be co-administered with other caspase or ICE inhibitors to increase the effect of therapy or prophylaxis against various IL-1-, apoptosis-, IGIF- or IFN- γ mediated diseases.

In addition, the compounds of this invention may be used in combination either conventional anti-inflammatory agents or with matrix metalloprotease inhibitors, lipoxygenase inhibitors and antagonists of cytokines other than IL-1 β .

The compounds of this invention can also be administered in combination with immunomodulators (e.g., bropirimine, anti-human alpha-interferon antibody, IL-2,

GM-CSF, methionine enkephalin, interferon-alpha, diethyldithiocarbamate, tumor necrosis factor, naltrexone and EPO), with prostaglandins, or with antiviral agents (e.g., 3TC, polysulfated polysaccharides, ganciclovir, 5 ribavirin, acyclovir, alpha interferon, trimethotrexate and fancyclovir) or prodrugs of these or related compounds to prevent or combat IL-1-mediated disease symptoms such as inflammation.

When the compounds of this invention are 10 administered in combination therapies with other agents, they may be administered sequentially or concurrently to the patient. Alternatively, pharmaceutical or prophylactic compositions according to this invention comprise a combination of a compound of formula (I) or 15 (II) and another therapeutic or prophylactic agent.

The pharmaceutical compositions of this invention may be administered orally, parenterally, by 20 inhalation spray, topically, rectally, nasally, buccally, vaginally or via an implanted reservoir. We prefer oral administration. The pharmaceutical compositions of this invention may contain any conventional non-toxic 25 pharmaceutically-acceptable carriers, adjuvants or vehicles. In some cases, the pH of the formulation may be adjusted with pharmaceutically acceptable acids, bases or buffers to enhance the stability of the formulated compound or its delivery form. The term parenteral as used herein includes subcutaneous, intracutaneous, 30 intravenous, intramuscular, intra-articular, intrasynovial, intrasternal, intrathecal, intralesional and intracranial injection or infusion techniques.

The pharmaceutical compositions may be in the 35 form of a sterile injectable preparation, for example, as a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to techniques known in the art using suitable dispersing or wetting

- 44 -

agents (such as, for example, Tween 80) and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example, 5 as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are mannitol, water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending 10 medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or diglycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically-acceptable oils, such as 15 olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant, such as those described in Pharmacopeia Helvetica, or a similar alcohol.

20 The pharmaceutical compositions of this invention may be orally administered in any orally acceptable dosage form including, but not limited to, capsules, tablets, and aqueous suspensions and solutions. In the case of tablets for oral use, carriers which are 25 commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions are administered 30 orally, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening and/or flavoring and/or coloring agents may be added.

35 The pharmaceutical compositions of this invention may also be administered in the form of

- 45 -

suppositories for rectal administration. These compositions can be prepared by mixing a compound of this invention with a suitable non-irritating excipient which is solid at room temperature but liquid at the rectal 5 temperature and therefore will melt in the rectum to release the active components. Such materials include, but are not limited to, cocoa butter, beeswax and polyethylene glycols.

Topical administration of the pharmaceutical 10 compositions of this invention is especially useful when the desired treatment involves areas or organs readily accessible by topical application. For application topically to the skin, the pharmaceutical composition should be formulated with a suitable ointment containing 15 the active components suspended or dissolved in a carrier. Carriers for topical administration of the compounds of this invention include, but are not limited to, mineral oil, liquid petroleum, white petroleum, propylene glycol, polyoxyethylene polyoxypropylene 20 compound, emulsifying wax and water. Alternatively, the pharmaceutical composition can be formulated with a suitable lotion or cream containing the active compound suspended or dissolved in a carrier. Suitable carriers include, but are not limited to, mineral oil, sorbitan 25 monostearate, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water. The pharmaceutical compositions of this invention may also be topically applied to the lower intestinal tract by rectal suppository formulation or in a suitable enema 30 formulation. Topically-administered transdermal patches are also included in this invention.

The pharmaceutical compositions of this 35 invention may be administered by nasal aerosol or inhalation. Such compositions are prepared according to techniques well-known in the art of pharmaceutical

- 46 -

formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other solubilizing or dispersing agents known in the art.

Dosage levels of between about 0.01 and about 100 mg/kg body weight per day, preferably between 0.5 and about 75 mg/kg body weight per day and most preferably between about 1 and 50 mg/kg body weight per day of the active ingredient compound are useful in a monotherapy for the prevention and treatment of IL-1-, apoptosis-, 10 IGIF-, and IFN- γ mediated diseases, including inflammatory diseases, autoimmune diseases, destructive bone disorders, proliferative disorders, infectious diseases, 15 degenerative diseases, necrotic diseases, inflammatory peritonitis, osteoarthritis, acute pancreatitis, chronic pancreatitis, asthma, adult respiratory distress syndrome, glomerulonephritis, rheumatoid arthritis, systemic lupus erythematosus, scleroderma, chronic 20 thyroiditis, Graves' disease, autoimmune gastritis, insulin-dependent diabetes mellitus (Type I), autoimmune hemolytic anemia, autoimmune neutropenia, thrombocytopenia, chronic active hepatitis, myasthenia gravis, inflammatory bowel disease, Crohn's disease, 25 psoriasis, graft vs. host disease, osteoporosis, multiple myeloma-related bone disorder, acute myelogenous leukemia, chronic myelogenous leukemia, metastatic melanoma, Kaposi's sarcoma, multiple myeloma, sepsis, septic shock, Shigellosis, Alzheimer's disease, 30 Parkinson's disease, cerebral ischemia, myocardial ischemia, spinal muscular atrophy, multiple sclerosis, AIDS-related encephalitis, HIV-related encephalitis, aging, alopecia, neurological damage due to stroke, ulcerative colitis, traumatic brain injury, organ 35 transplant rejection, infectious hepatitis, juvenile

- 47 -

diabetes, lichenplanus, acute dermatomyositis, eczema, primary cirrhosis, uveitis, Behcet's disease, atopic skin disease, pure red cell aplasia, aplastic anemia, amyotrophic lateral sclerosis, nephrotic syndrome and
5 systemic diseases or diseases with effects localized in the liver or other organs having an inflammatory or apoptotic component caused by excess dietary alcohol intake or viruses, such as HBV, HCV, HGV, yellow fever virus, dengue fever virus, and Japanese encephalitis
10 virus.

Typically, the pharmaceutical compositions of this invention will be administered from about 1 to 5 times per day or alternatively, as a continuous infusion. Such administration can be used as a chronic or acute
15 therapy. The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. A typical preparation will contain from about 5% to about 95%
20 active compound (w/w). Preferably, such preparations contain from about 20% to about 80% active compound.

When the compositions of this invention comprise a combination of a compound of formulae (I) or (II) and one or more additional therapeutic or
25 prophylactic agents, both the compound and the additional agent should be present at dosage levels of between about 10% to 80% of the dosage normally administered in a monotherapy regime.

Upon improvement of a patient's condition, a
30 maintenance dose of a compound, composition or combination of this invention may be administered, if necessary. Subsequently, the dosage or frequency of administration, or both, may be reduced, as a function of the symptoms, to a level at which the improved condition
35 is retained when the symptoms have been alleviated to the

- 48 -

desired level, treatment should cease. Patients may, however, require intermittent treatment on a long-term basis upon any recurrence or disease symptoms.

As the skilled artisan will appreciate, lower 5 or higher doses than those recited above may be required. Specific dosage and treatment regimens for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health status, sex, diet, time of 10 administration, rate of excretion, drug combination, the severity and course of the disease, and the patient's disposition to the disease and the judgment of the treating physician.

IL-1 or apoptosis mediated diseases may be 15 treated or prevented by the compounds of this invention. Such diseases include, but are not limited to, inflammatory diseases, autoimmune diseases, destructive bone disorders, proliferative disorders, infectious diseases, and degenerative diseases.

The IL-1 or apoptosis mediated inflammatory 20 diseases which may be treated or prevented include, but are not limited to osteoarthritis, acute pancreatitis, chronic pancreatitis, asthma, inflammatory peritonitis, and adult respiratory distress syndrome. Preferably the 25 inflammatory disease is osteoarthritis or acute pancreatitis.

The IL-1 or apoptosis mediated autoimmune 30 diseases which may be treated or prevented include, but are not limited to, glomerulonephritis, rheumatoid arthritis, systemic lupus erythematosus, scleroderma, chronic thyroiditis, Graves' disease, autoimmune gastritis, insulin-dependent diabetes mellitus (Type I), autoimmune hemolytic anemia, autoimmune neutropenia, thrombocytopenia, chronic active hepatitis, myasthenia 35 gravis, multiple sclerosis, inflammatory bowel disease,

- 49 -

Crohn's disease, psoriasis, and graft vs. host disease. Preferably the autoimmune disease is rheumatoid arthritis, inflammatory bowel disease, Crohn's disease, or psoriasis.

5 IL-1 or apoptosis mediated destructive bone disorders which may be treated or prevented include, but are not limited to, osteoporosis and multiple myeloma-related bone disorder.

10 The IL-1 or apoptosis mediated proliferative diseases which may be treated or prevented include, but are not limited to, acute myelogenous leukemia, chronic myelogenous leukemia, metastatic melanoma, Kaposi's sarcoma, and multiple myeloma.

15 The IL-1 or apoptosis mediated infectious diseases which may be treated or prevented include, but are not limited to, sepsis, septic shock, and Shigellosis.

20 The IL-1 or apoptosis mediated degenerative or necrotic diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, Alzheimer's disease, Parkinson's disease, cerebral ischemia, and myocardial ischemia. Preferably, the degenerative disease is Alzheimer's disease.

25 The IL-1 or apoptosis mediated degenerative diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, Alzheimer's disease, Parkinson's disease, cerebral ischemia, myocardial ischemia, spinal muscular atrophy, multiple sclerosis, AIDS-related encephalitis, HIV-related encephalitis, aging, alopecia, and neurological damage due to stroke.

30 Other diseases having an inflammatory or apoptotic component may be treated or prevented by the compounds of this invention. Such diseases may be 35 systemic diseases or diseases with effects localized in

- 50 -

the liver or other organs and may be caused by, for example, excess dietary alcohol intake or viruses, such as HBV, HCV, HGV, yellow fever virus, dengue fever virus, and Japanese encephalitis virus.

5 IGIF- or IFN- γ -mediated diseases may also be treated or prevented by the compounds of this invention. Such diseases include, but are not limited to, inflammatory, infectious, autoimmune, proliferative, neurodegenerative and necrotic conditions.

10 The IGIF- or IFN- γ -mediated inflammatory diseases which may be treated or prevented include, but are not limited to osteoarthritis, acute pancreatitis, chronic pancreatitis, asthma, rheumatoid arthritis, inflammatory bowel disease, Crohn's disease, ulcerative colitis, 15 cerebral ischemia, myocardial ischemia and adult respiratory distress syndrome. Preferably, the inflammatory disease is rheumatoid arthritis, ulcerative colitis, Crohn's disease, hepatitis or adult respiratory distress syndrome.

20 The IGIF- or IFN- γ -mediated infectious diseases which may be treated or prevented include, but are not limited to infectious hepatitis, sepsis, septic shock and Shigellosis.

25 The IGIF- or IFN- γ -mediated autoimmune diseases which may be treated or prevented include, but are not limited to glomerulonephritis, systemic lupus erythematosus, scleroderma, chronic thyroiditis, Graves' disease, autoimmune gastritis, insulin-dependent diabetes mellitus (Type I), juvenile diabetes, autoimmune 30 hemolytic anemia, autoimmune neutropenia, thrombocytopenia, myasthenia gravis, multiple sclerosis, psoriasis, lichenplanus, graft vs. host disease, acute dermatomyositis, eczema, primary cirrhosis, hepatitis, uveitis, Behcet's disease, atopic skin disease, pure red 35 cell aplasia, aplastic anemia, amyotrophic lateral

- 51 -

sclerosis and nephrotic syndrome. Preferably, the autoimmune disease is glomerulonephritis, insulin-dependent diabetes mellitus (Type I), juvenile diabetes, psoriasis, graft vs. host disease, or hepatitis.

5 More preferred diseases which may be treated or prevented by the compounds of this invention include rheumatoid arthritis, inflammatory bowel disease, including Crohn's disease and ulcerative colitis, inflammatory peritonitis, septic shock, pancreatitis, 10 traumatic brain injury, organ transplant rejection, osteoarthritis, and asthma.

Accordingly, one embodiment of this invention provides a method for treating or preventing an IL-1 or apoptosis mediated disease in a subject comprising the 15 step of administering to the subject any compound, pharmaceutical composition, or combination described herein and a pharmaceutically acceptable carrier.

Another embodiment of this invention provides a method for decreasing IGIF production in a subject 20 comprising the step of administering to the subject any compound, pharmaceutical composition, or combination described herein and a pharmaceutically acceptable carrier.

Another embodiment of this invention provides a 25 method for decreasing IFN- γ production in a subject comprising the step of administering to the subject any compound, pharmaceutical composition, or combination described herein and a pharmaceutically acceptable carrier.

30 Although this invention focuses on the use of the compounds disclosed herein for preventing and treating IL-1, apoptosis-, IGIF, and IFN- γ -mediated diseases, the compounds of this invention can also be used as inhibitory agents for other cysteine proteases.

The compounds of this invention are also useful as commercial reagents which effectively bind to caspases or other cysteine proteases including, but not limited to ICE. As commercial reagents, the compounds of this 5 invention, and their derivatives, may be used to block proteolysis of a target peptide in biochemical or cellular assays for ICE and ICE homologs or may be derivatized to bind to a stable resin as a tethered substrate for affinity chromatography applications. 10 These and other uses which characterize commercial cysteine protease inhibitors will be evident to those of ordinary skill in the art.

In order that this invention be more fully understood, the following examples are set forth. These 15 examples are for the purpose of illustration only and are not to be construed as limiting the scope of the invention in any way.

General Methods

20 The compounds of this invention may be evaluated in various biological assays, including those described in Examples 2-4.

Other assays that may be used to evaluate the compounds of this invention are disclosed in PCT 25 application PCT/US96/20843, published June 26, 1997, under publication no. WO 97/22619, which is incorporated herein by reference. Such assays include in vivo bioavailability determinations, pharmacokinetic studies in the mouse, inhibition of ICE homologs, inhibition of 30 apoptosis, in vivo acute assay for anti-inflammatory efficacy, measurement of blood levels, IGIF assays, mouse carrageenan peritoneal inflammation assay, and type II collagen-induced arthritis.

Example 2

1. Enzyme assay with UV-visible substrate

15 This assay is run using an Succinyl-Tyr-Val-Ala-Asp-p-Nitroanilide substrate. Synthesis of analogous substrates is described by L.A. Reiter (Int. J. Peptide Protein Res., 43, pp. 87-96 (1994)). The assay mixture contains:

20 65 μ l buffer (10mM Tris, 1 mM DTT, 0.1% CHAPS @pH 8.1)
10 μ l ICE (50 nM final concentration to give a rate of
~1mOD/min)

5 μ l DMSO/Inhibitor mixture
20 μ l 400 μ M Substrate (80 μ M final concentration)
25 100 μ l total reaction volume

The visible ICE assay is run in a 96-well microtiter plate. Buffer, ICE and DMSO (if inhibitor is present) are added to the wells in the order listed. The components are left to incubate at room temperature for 15 minutes starting at the time that all components are present in all wells. The microtiter plate reader is set to incubate at 37 °C. After the 15 minute incubation, substrate is added directly to the wells and the reaction 35 is monitored by following the release of the chromophore

- 60 -

(pNA) at 405 - 603 nm at 37 °C for 20 minutes. A linear fit of the data is performed and the rate is calculated in mOD/min. DMSO is only present during experiments involving inhibitors, buffer is used to make up the
5 volume to 100 μ l in the other experiments.

2. Enzyme Assay with Fluorescent Substrate

This assay is run essentially according to Thornberry et al., Nature, 356 pp. 768-774 (1992), using substrate 17 referenced in that article. The substrate is: Acetyl-Tyr-Val-Ala-Asp-amino-4-methylcoumarin (AMC). The following components are mixed:

15 65 μ l buffer(10mM Tris, 1mM DTT, 0.1% CHAPS @pH8.1)
10 μ l ICE (2 - 10 nM final concentration)
5 μ l DMSO/inhibitor solution
20 μ l 150 μ M Substrate (30 μ M final)
100 μ l total reaction volume

20 The assay is run in a 96-well microtiter plate. Buffer and ICE are added to the wells. The components are left to incubate at 37 °C for 15 minutes in a temperature-controlled wellplate. After the 15 minute incubation, the reaction is started by adding substrate
25 directly to the wells and the reaction is monitored at 37 °C for 30 minutes by following the release of the AMC fluorophore using an excitation wavelength for 380 nm and an emission wavelength of 460 nm. A linear fit of the data for each well is performed and a rate is determined
30 in fluorescence units per second.

For determination of enzyme inhibition constants (K_i) or the mode of inhibition (competitive, uncompetitive or noncompetitive), the rate data determined in the enzyme assays at varying inhibitor
35 concentrations are computer-fit to standard enzyme

kinetic equations (see I.H. Segel, Enzyme Kinetics, Wiley-Interscience, 1975).

The determination of second order rate constants for irreversible inhibitors was performed by fitting the fluorescence vs time data to the progress equations of Morrison. Morrison, J.F., Mol. Cell. Biophys., 2, pp. 347-368 (1985). Thornberry et al. published a description of these methods for measurement of rate constants of irreversible inhibitors of ICE.

10 Thornberry, N.A., et al. Biochemistry, 33, pp. 3923-3940 (1994). For compounds where no prior complex formation can be observed kinetically, the second order rate constants (k_{inact}) are derived directly from the slope of the linear plots of k_{obs} vs. inhibitor concentration [I].

15 For compounds where prior complex formation to the enzyme can be detected, the hyperbolic plots of k_{obs} vs. [I] are fit to the equation for saturation kinetics to first generate K_i and k' . The second order rate constant k_{inact} is then given by k'/K_i .

3. PBMC Cell assay

IL-1 β Assay with a Mixed Population of Human Peripheral Blood Mononuclear Cells (PBMC) or Enriched Adherent Mononuclear Cells

25

Processing of pre-IL-1 β by ICE can be measured in cell culture using a variety of cell sources. Human PBMC obtained from healthy donors provides a mixed population of lymphocyte subtypes and mononuclear cells that produce a spectrum of interleukins and cytokines in response to many classes of physiological stimulators. Adherent mononuclear cells from PBMC provides an enriched source of normal monocytes for selective studies of cytokine production by activated cells.

35

- 62 -

Experimental Procedure:

An initial dilution series of test compound in DMSO or ethanol is prepared, with a subsequent dilution into RPMI-10% FBS media (containing 2 mM L-glutamine, 10 mM HEPES, 50 U and 50 ug/ml pen/strep) respectively to yield drugs at 4x the final test concentration containing 0.4% DMSO or 0.4% ethanol. The final concentration of DMSO is 0.1% for all drug dilutions. A concentration titration which brackets the apparent K_i for a test compound determined in an ICE inhibition assay is generally used for the primary compound screen.

Generally 5-6 compound dilutions are tested and the cellular component of the assay is performed in duplicate, with duplicate ELISA determinations on each cell culture supernatant.

PBMC Isolation and IL-1 Assay:

Buffy coat cells isolated from one pint human blood (yielding 40-45 ml final volume plasma plus cells) are diluted with media to 80 ml and LeukoPREP separation tubes (Becton Dickinson) are each overlaid with 10 ml of cell suspension. After 15 min centrifugation at 1500-1800 xg, the plasma/media layer is aspirated and then the mononuclear cell layer is collected with a Pasteur pipette and transferred to a 15 ml conical centrifuge tube (Corning). Media is added to bring the volume to 15 ml, gently mix the cells by inversion and centrifuge at 300 xg for 15 min. The PBMC pellet is resuspended in a small volume of media, the cells are counted and adjusted to 6×10^6 cells/ml.

For the cellular assay, 1.0 ml of the cell suspension is added to each well of a 24-well flat bottom tissue culture plate (Corning), 0.5 ml test compound dilution and 0.5 ml LPS solution (Sigma #L-3012; 20 ng/ml solution prepared in complete RPMI media; final LPS

- 63 -

concentration 5 ng/ml). The 0.5 ml additions of test compound and LPS are usually sufficient to mix the contents of the wells. Three control mixtures are run per experiment, with either LPS alone, solvent vehicle 5 control, and/or additional media to adjust the final culture volume to 2.0 ml. The cell cultures are incubated for 16-18 hr at 37 °C in the presence of 5% CO₂.

At the end of the incubation period, cells are 10 harvested and transferred to 15 ml conical centrifuge tubes. After centrifugation for 10 min at 200 xg, supernatants are harvested and transferred to 1.5 ml Eppendorf tubes. It may be noted that the cell pellet may be utilized for a biochemical evaluation of pre-IL-1β 15 and/or mature IL-1β content in cytosol extracts by Western blotting or ELISA with pre-IL-1β specific antisera.

Isolation of Adherent Mononuclear cells:

PBMC are isolated and prepared as described above. Media (1.0 ml) is first added to wells followed by 0.5 ml of the PBMC suspension. After a one hour incubation, plates are gently shaken and nonadherent cells aspirated from each well. Wells are then gently 25 washed three times with 1.0 ml of media and final resuspended in 1.0 ml media. The enrichment for adherent cells generally yields 2.5-3.0 x 10⁵ cells per well. The addition of test compounds, LPS, cell incubation conditions and processing of supernatants proceeds as 30 described above.

ELISA:

Quantikine kits (R&D Systems) may be used for the measurement of mature IL-1β. Assays are performed 35 according to the manufacturer's directions. Mature IL-1β

- 64 -

levels of about 1-3 ng/ml in both PBMC and adherent mononuclear cell positive controls are observed. ELISA assays are performed on 1:5, 1:10 and 1:20 dilutions of supernatants from LPS-positive controls to select the 5 optimal dilution for supernatants in the test panel.

The inhibitory potency of the compounds can be represented by an IC₅₀ value, which is the concentration of inhibitor at which 50% of mature IL-1 β is detected in the supernatant as compared to the positive controls.

10 The skilled practitioner realizes that values obtained in cell assays may depend on multiple factors. The values may not necessarily represent fine quantitative results.

15 Example 3

Whole Blood Assay for IL-1 β Production

Whole blood assay IC₅₀ values for compounds of this invention were obtained using the method described below:

20 Purpose:
The whole blood assay is a simple method for measuring the production of IL-1 β (or other cytokines) and the activity of potential inhibitors. The complexity 25 of this assay system, with its full complement of lymphoid and inflammatory cell types, spectrum of plasma proteins and red blood cells is an ideal in vitro representation of human in vivo physiologic conditions.

30 Materials:

Pyrogen-free syringes (~ 30 cc)
Pyrogen-free sterile vacuum tubes containing lyophilized Na₂EDTA (4.5 mg/10 ml tube)
Human whole blood sample (~ 30-50 cc)
35 1.5 ml Eppendorf tubes

- 65 -

Test compound stock solutions (~ 25mM in DMSO or other solvent)
Endotoxin-free sodium chloride solution (0.9%) and HBSS
Lipopolysaccharide (Sigma; Cat.# L-3012) stock solution
5 at 1mg/ml in HBSS
IL-1 β ELISA Kit (R & D Systems; Cat # DLB50)
TNF α ELISA Kit (R & D Systems; Cat # DTA50)
Water bath or incubator

10 Whole Blood Assay Experimental Procedure:

Set incubator or water bath at 30 °C. Aliquot 0.25 ml of blood into 1.5 ml Eppendorf tubes. Note: be sure to invert the whole blood sample tubes after every two aliquots. Differences in replicates may result if 15 the cells sediment and are not uniformly suspended. Use of a positive displacement pipette will also minimize differences between replicate aliquots.

Prepare drug dilutions in sterile pyrogen-free saline by serial dilution. A dilution series which 20 brackets the apparent K_i for a test compound determined in an ICE inhibition assay is generally used for the primary compound screen. For extremely hydrophobic compounds, prepare compound dilutions in fresh plasma obtained from the same blood donor or in PBS-containing 25 5% DMSO to enhance solubility.

Add 25 μ l test compound dilution or vehicle control and gently mix the sample. Then add 5.0 μ l LPS solution (250 ng/ml stocked prepared fresh: 5.0 ng/ml final concentration LPS), and mix again. Incubate the 30 tubes at 30 °C in a water bath for 16-18 hr with occasional mixing. Alternatively, the tubes can be placed in a rotator set at 4 rpm for the same incubation period. This assay should be set up in duplicate or triplicate with the following controls: negative control 35 - no LPS; positive control - no test inhibitor; vehicle

- 66 -

control - the highest concentration of DMSO or compound solvent used in the experiment. Additional saline is added to all control tubes to normalize volumes for both control and experimental whole blood test samples.

5 After the incubation period, whole blood samples are centrifuged for 10 minutes at ~ 2000 rpm in the microfuge, plasma is transferred to a fresh microfuge tube and centrifuged at 1000 x g to pellet residual platelets if necessary. Plasma samples may be stored
10 frozen at -70 °C prior to assay for cytokine levels by ELISA.

ELISA:

15 R & D Systems (614 McKinley Place N.E.
Minneapolis, MN 55413) Quantikine kits may be used for measurement of IL-1 β and TNF- α . The assays are performed according to the manufacturer's directions. IL-1 β levels of ~ 1-5 ng/ml in positive controls among a range of individuals may be observed. A 1:200 dilution of plasma
20 for all samples is usually sufficient for experiments for ELISA results to fall on the linear range of the ELISA standard curves. It may be necessary to optimize standard dilutions if you observe differences in the whole blood assay. Nerad, J.L. et al., J. Leukocyte

Example 4

30 The antiviral efficacy of compounds may be evaluated in various in vitro and in vivo assays. For example, compounds may be tested in in vitro viral replication assays. In vitro assays may employ whole cells or isolated cellular components. In vivo assays include animal models for viral diseases. Examples of such animal models include, but are not limited to,
35 rodent models for HBV or HCV infection, the Woodchuck

model for HBV infection, and chimpanzee model for HCV infection.

Compounds of this invention may also be evaluated in animal models for dietary alcohol-induced
5 disease.

Preparation of (N-Benzylloxycarbonyl-hydrazino)-acetic acid tert-butyl ester (1). To a mixture of benzyl carbamate (25.0 g, 150 mmol), potassium carbonate (20.78 g, 150 mmol) in 230 mL of dimethylformamide (DMF) was added tert-butyl bromoacetate (26.4 g, 145 mmol). The suspension was stirred at room temperature for 16 hours. The reaction mixture was diluted with 1000 mL of ethyl acetate, washed with ice water then water three times.

The organic layer was dried over anhydrous Na₂SO₄, filtered and evaporated in vacuo to afford a clear oil, which was purified by flash chromatography using hexane/EtOAc (9/1 to 7/3) to give 23.55 g (62% yield) of the title compound. ¹H-NMR (500MHz, CDCl₃) δ 1.45 (s, 9H), 3.55 (s, 2H), 4.20 (br, 1H), 5.15 (s, 2H), 6.70 (br, 1H), 7.40 (s, 5H). Analytical HPLC*: 10.11 min.

Preparation of 2-(1,3-Dioxo-1,3-dihydro-isoindol-2-yl)-pentanedioic acid 5-benzyl ester (2). A mixture of γ -benzyl-l-glutamate (11.85 g, 50 mmol) and phthalic anhydride (7.40 g, 50 mmol) in toluene (150 mL) was refluxed with a Dean-Stark tube for 16 hours. Solvent was removed under reduced pressure. The residue was purified by flash chromatography using hexane/ethyl acetate/acetic acid (90/10/1 to 50/50/1) to afford 14.83 g (80% yield) of the title compound. $^1\text{H-NMR}$ (500MHz, CDCl_3) δ 2.40-2.70 (m, 4H), 4.95-5.10 (m, 3H), 7.27-7.40 (m, 5H), 7.70-7.95 (m, 4H). Preparation of 5-(N'-Benzylloxycarbonyl-N-tert-butoxycarbonylmethyl-hydrazino)-4-(1,3-dioxo-1,3-dihydro-isoindol-2-yl)-5-oxo-pentanoic acid benzyl ester (3). To a solution of 2-(1,3-dioxo-1,3-dihydro-isoindol-2-yl)-pentanedioic acid 5-benzyl ester (2) (1.84 g, 5 mmol) in 25 mL of dichloromethane with 0.1 mL of dimethylformamide (DMF) was dropwise added oxalyl chloride (666 mg, 5.25 mmol) at 0°C. The solution was stirred at 0°C for 30 min then at room temperature for one hour. K_2CO_3 (1.03 g) was added at 0°C followed by a solution of (N-benzylloxycarbonyl-hydrazino)-acetic acid tert-butyl ester (1) (1.40 g, 5 mmol) in 5 ml of dichloromethane. The mixture was stirred at room temperature for 16 hours. The solvent was removed under reduced pressure and the residue was suspended in 400 mL of ethyl acetate, washed with water (200 mL x 2) then brine (200 mL x 2). The organic layer was dried over anhydrous Na_2SO_4 , filtered, concentrated in vacuo to afford 2.8 g of clear oil. Flash chromatography using hexane/ethyl acetate (9/1 to 7/3) gave 1.93 g (61% yield) of the title compound. $^1\text{H-NMR}$ (500MHz, CDCl_3) δ 1.35 (s, 9H), 2.30-2.55 (m, 4H), 4.70-5.20 (br, 4H), 5.08 (s, 2H), 5.30 (m, 1H), 7.26-7.35

Preparation of [6-(1,3-Dioxo-1,3-dihydro-isoindol-2-yl)-3,7-dioxo-[1,2]diazepan-1-yl]-acetic acid tert-butyl ester (4). A suspension of 5-(N'-benzyloxycarbonyl-N-tert-butoxycarbonylmethyl-hydrazino)-4-(1,3-dioxo-1,3-dihydro-isoindol-2-yl)-5-oxo-pentanoic acid benzyl ester (3) and 10% palladium on carbon (250 mg) in tetrahydrofuran (THF) (30 mL) and DMF (3mL) was stirred under hydrogen atmosphere for 16 hours. The mixture was filtered through Celite and the filtrate was evaporated *in vacuo*. The residue was dissolved in 30 mL of dichloromethane. 1-(3-Dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC) (770 mg, 4 mmol) was added and the solution was stirred at room temperature for 3.5 hours. Solvent was removed *in vacuo* and the residue was dissolved in ethyl acetate (300 mL), then washed with water (100 mL x 2). The organic layer was dried over anhydrous Na₂SO₄, filtered, purified by flash chromatography using hexane/ethyl acetate (85/15 to 50/50) to afford 1.06 g (75% yield) of the title compound. ¹H-NMR (500 MHz, CDCl₃) δ 1.40 (s, 9H), 2.30-2.40 (m, 1H), 2.40-2.50 (m, 1H), 3.05-3.12 (m, 1H), 3.38-3.48 (m, 1H), 3.90-4.00 (d, 1H), 4.60-4.70 (d, 1H), 5.55-5.63 (m, 1H), 7.65 (s, 1H), 7.75-7.7.9 (m, 2H), 7.88-7.92 (m, 2H). Insofar as the compounds of this invention are able to inhibit caspases, particularly ICE, in vitro and furthermore, may be delivered orally to mammals, they are 10 of evident clinical utility for the treatment of IL-1-, apoptosis-, IGIF-, and IFN- γ -mediated diseases.

While we have described a number of embodiments of this invention, it is apparent that our basic constructions may be altered to provide other embodiments 15 which utilize the products and processes of this invention.

A. CLASSIFICATION OF SUBJECT MATTER

IPC 6 C07D243/02 A61K31/55 C07D401/14 C07D405/12 C07D401/12

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
IPC 6 C07D A61K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	US 5 552 400 A (ROLAND E. DOLLE ET AL.) 3 September 1996 cited in the application see column 3 - column 6 -----	1,19

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

* Special categories of cited documents :

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the International filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the International filing date but later than the priority date claimed

- "T" later document published after the International filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- "&" document member of the same patent family

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 99/05124

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: 16-18 because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claims 16-18 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

The additional search fees were accompanied by the applicant's protest.
 No protest accompanied the payment of additional search fees.
